

Anexty - the target concept v1.0.0

Administration

1. User should be able to insert its own Google analytics code
 - Textarea in user administration settings
 - Code (customer's GA) will be inserted on public part of customer pages **DONE**
 - Also ours Google analytics code will be inserted in customers public page **This is quite not possible to place 2 Google Analytics code on one page. Google policy violates.**
2. Webmaster tools - same as google analytics **DONE**
3. Every page with content in customer administration should have SEO BOX located on bottom of page
 - SEO BOX will contains two tabs
 - one with editable SEO related properties (title, description, keywords) **DONE**
 - second tab will contains predefined text with some SEO tips.
 - SEO tips will be article editable from our superadmin
4. User (with full version) can connect it's own domain with it's site on anexty. So somewhere in it's administration settings should be manual "how to connect your domain to your account" and input, where will user insert domain name, that he had connected to it's account. Administration have to display user proper information like this on picture **Partially done, merging pending. - On the page**

@	A	83.167.253.87
@	AAAA	2a01:430:225::9
@	MX	mail.rosti.cz.
www	CNAME	@

where user will set his domain there we will display "Jquery Accordion display" So user can see FAQ for that section underneath the same page. This will be static and hardcoded.

- When user save input (with domain name), then system will check if are DNS records OK (A,AAAA,MX,CNAME for www). And then system will display result of this check ("Your DNS records settings are OK. Your site is connected", "There are problems with connection between ours servers and your domain, please contact support"). The DNS records are not checked by code itself and there is no such error handled as of that. But once the user add his main domain in success message we will display "Make sure you have updated your DNS records correctly. Your DNS records settings will take upto 72 hrs to be configured for global changes" this is standard message as per international guidelines for new domains and DNS settings frequent changes.

- After connection with domain - user can create some email accounts from it's administration and access this email accounts thru web mail client (<https://roundcube.net/>). Link to email client is "email icon" in administration.

5. Super-administration should have interface, where we can write articles (News) with WYSIWYG editor. This articles will be displayed at users admin dashboard. Articles could be written in 3 languages. Only articles in proper language will be displayed on users admin dashboard (we've got information about user preferred language from it's administration settings). News will be global announcement , So whatever is posted can be controlled as Public view to all users. It won't run on any preference it will display to all the available customers. Regarding language we will see it after e-commerce with all languages at once or else it will engage multiple time same work.
6. Homepage should be editable (Jiří knows more about this point, so please ask him). -- **DONE**
7. We should see in our super-administration (in users listing) what kind of package users have and information about packages paid until "date". **In progress**
8. We should see in super-administration information about users preferred language. **This will be followed when language options we will work on.**
9. System should send user email notification 14days, 7days, 1day before its subscription expiration. User should be able to renew its

subscription and buy another time 6,12,24 months. We expect that system will work very easy and smooth in this way. **OK**

10. Package system - we already talk about more simply options, when user register only by email. The user gets the first 10 days trial and then he can choose upgrade **The minimum time Super Admin can set will be 15 Days, because above you have mentioned that 14 days will be the email notification feature working so it will be a defined rule.**

1) Continue as free - with banner **OK**

2) Upgrade to Full version with blog and then he choose subscription duration from 6 to 24 months **OK**

- we can change Full version price from our super-administration **OK**

11. We want in our super-administration input, that content will be displayed on every public page in bottom part of footer. Input can be HTML, wysiwyg is not needed. Example content "This page was created with <a href="<http://www.anexty.com>">anexty" **DONE**

12. Better design for blocks - **this point was discussed on skype - IN PROGRESS.....**

13. User can edit contact form like add box **We can add more blocks with more boxes available, but box can't be added in contact form in mid box.**

14. User can change language at setting - Czech, English, Spanish. When user first time visit anexty.com, system automatically detect correct language from browser preferences (Accept-Language header). **Language we will do after ecommerce part is ready.**

15. Buttons with editable style **Not possible, we can change buttons in current blocks so let us know the same. But user or frontend style changes on buttons are not possible.**
